

### Abstract of the Disclosure

5        Typically-applied binder materials for imparting wet strength to soft, absorbent  
paper sheets, such as are useful as household paper towels and the like, include an  
epoxy-reactive polymer, such as a carboxyl-functional polymer, and an epoxy-functional  
polymer. These binder materials can be cured at ambient temperature over a period of  
days and do not impart objectionable odor to final product when wetted.
